

Not Your Grandfather's Copper Mine

The Pebble Partnership's Five Core Principles:

- 1** Pebble must benefit people—Pebble is for all Alaskans
- 2** Pebble must coexist with healthy fish, wildlife and other valued natural resources
- 3** **Pebble must apply the world's best and most advanced science**
- 4** Pebble must help build sustainable communities
- 5** At Pebble, we must listen before we act

It's a fact—mining has changed tremendously in recent years. The science and technology available today is light years ahead of what existed even a few years ago. As innovation continues to advance, so does the safety and reliability of modern mines.

What does that mean for Pebble?

It means the technology and engineering standards we use will be more advanced than any other mine in Alaska or around the world. We will apply science to protect clean water, minimize habitat disturbance, protect and enhance fisheries, and to return all of the lands we affect to a beneficial public use after mining is complete.

Pebble will be the world's most modern mine, engineered to protect all the things Alaskans value. Or it won't be built at all.

“We will go beyond compliance to establish an independent panel of experts, knowledgeable in Alaska, to scrutinize our work. Their particular focus will be the crucial issue of water and water quality.”

—Cynthia Carroll, CEO of Anglo American plc, one of two progressive mining companies of The Pebble Partnership
